

Vendor Management

Managing vendors now requires a multitude of tests to ensure that the associated risks are kept to a minimum. The proliferation of complex supply chains has made vendor management a high-risk area for many organizations. In addition to duplicate payments, vendor data quality, conflicts of interest, and watch-list comparisons are key areas for testing.

| | |
|--------------------------------------|---|
| <p>Vendor Data Quality</p> | <p>Look for missing or incomplete critical data when input validation is weak or non-existent. Use the various Arbutus functions to test for completeness by deploying filters and the Count command to document the results.</p> <p>IsBlank(<field name>) will tell you if a key character field such as the City field has no content.</p> <p>Format(<field name>) will display the underlying numeric/alpha content of a field. For example, to test the vendor telephone numbers for appropriate content, use the expected format of your supplier data to identify non-conforming numbers. In the US and Canada, telephone numbers consist of 10 digits. Your filter would look like this:</p> <pre>Format(Phone_No) <> "(999) 999-9999"</pre> |
| <p>Conflicts of Interest</p> | <p>Compare vendor and employee telephone numbers, addresses, bank accounts, and tax IDs to identify identical or similar entries. Use the SortNormalize function to standardize the data, then execute a many-to-many Join between the two files.</p> |
| <p>Watch List Comparisons</p> | <p>Download the GSA SAM file or the OFAC list and use the same process as the conflict of interest test to identify possible matching names or addresses. Click to learn how to download these two data sets. Download Technical documents</p> |
| <p>Inactive Vendors</p> | <p>A vendor account that has not been active leaves it open to fraud. To identify vendors who have not been active in the past year, download the payments data and the vendor master file. Then, run an unmatched Join between the two files on the vendor number with the vendor master as the primary file. The output will consist of all vendors who have not been active.</p> |

Employee Spending

Spending controls aren't always sophisticated enough to prevent unauthorized transactions in a timely manner. Whether it's P-Cards or Travel & Entertainment expenses, the sooner suspicious expenses can be detected, the sooner they can be resolved.

| | | |
|--|--|--|
| PCards and Travel & Entertainment | PCard Split Purchases | <p>The temptation to split a purchase into two transactions to circumvent PCard approval controls poses a perennial challenge. Additionally, two employees may collude by each claiming one of the purchases.</p> <p>This is easily addressed in Analyzer by (1) isolating the below-the-limit transactions by extracting them to a file, (2) extracting these records to a second, identical file, (3) executing a many-to-many Join between the two files with the employee number and vendor ID as the key fields, and (4) filtering for pairs of transactions that add up to an amount over the employee's limit.</p> <p>Additional filters can be invoked to specify pairs of transactions within x days of each other.</p> |
| PCards and Travel & Entertainment | Cardholders with Excessive Declined/Disputed Transactions | <p>Card processors can provide data files containing declined and disputed transactions by employee cardholders. Analyzer's enhanced Summarize command can identify employees with high rates of declines and disputes.</p> |
| PCards and Travel & Entertainment | Terminated Employees & Active Cards | <p>Suspicious transactions frequently occur in the period just before and after employees are terminated. Controls don't always result in timely invalidation of employee PCards, but prompt identification of such transactions is straightforward with Analyzer.</p> <p>A direct connection to Concur and other databases makes it possible to continuously compare employee transactions and termination dates.</p> |
| PCards and Travel & Entertainment | Multiple Cards per Employee | <p>With an automated download from the enterprise application, issued cards can be scanned with the Duplicates command to identify employees with more than one active card.</p> |
| PCards and Travel & Entertainment | Stale Claims | <p>Analyzing the T&E transaction date with the Age command will identify claims that are more than 30 days older than the report date.</p> |

GL JE Risk Scoring

Journal entries, particularly manual JEs that are posted close to end-of-period dates, need to be regularly scanned to identify high-risk items. Manual journal entries are high-risk items because they are not part of an automated process. JEs that fall around the end-of-period dates are also of concern.

| Amounts Just Below Approval Threshold | (Assumption: Threshold = \$5000) | | | | | | | | | | | | | | | | |

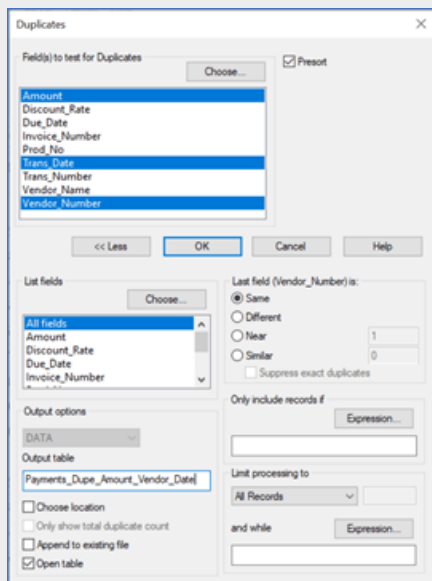

Duplicate Payments

Duplicate payments can be a significant source of financial leakage. Although some systems possess basic built-in duplicate detection, it's not likely that they will detect near duplicates that can come in different configurations. The enhanced Duplicates command in Analyzer has helped users to identify different kinds of fuzzy duplicates.

Same-Same-Same

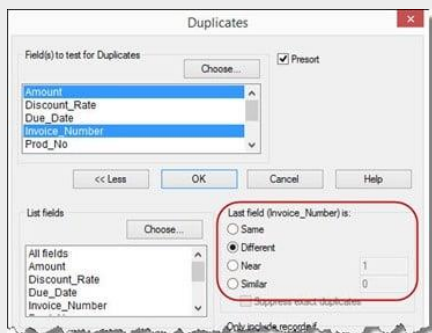

Detecting payments where one or more values are identical, such as same vendor, same amount, same date, is straightforward. In the Duplicates command dialog, select those fields from the "Field(s) to test for Duplicates" list.

You can select additional fields in the "List fields" list to send to the output, such as product number, that may enhance your follow-up analysis. And, finally, the output can be directed to a file in the "Output options" section by selecting "DATA" and naming the output file.

Same-Same-Different

If you're trying to detect same vendor, same amount, different invoice, selecting the "Different" parameter will identify those transactions.

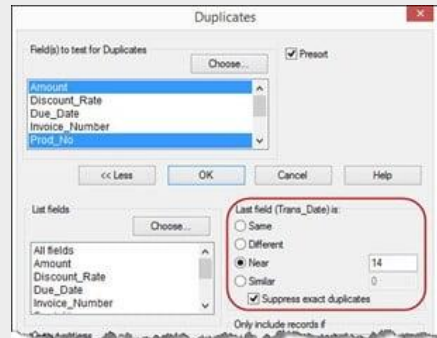

| | Vendor_Number | Amount | Invoice_Number | Prod_No | Trans_Date |
|---|---------------|-----------|----------------|---------|------------|
| 1 | 13070 | 98,423.48 | 540613 | AC102 | 08/03/2019 |
| 2 | 13070 | 98,423.48 | 5406613 | AC102 | 08/03/2019 |
| 3 | 10039 | 39,759.69 | 991548 | AC097 | 05/19/2019 |
| 4 | 10039 | 39,759.69 | 9961548 | AC091 | 05/19/2019 |
| 5 | 11072 | 7,119.57 | 4118706 | AC106 | 01/08/2019 |
| 6 | 11072 | 7,119.57 | 4639713 | AC071 | 06/13/2019 |
| 7 | 10673 | 6,746.47 | 5651681 | AA138 | 11/23/2019 |

Same-Same-Near

The "Near" parameter allows greater precision and focus. For example, you could search for same vendor, same month, within \$10 for amounts that are very close in value. As well, you could identify same vendor, same product, same amount, date within 14 days to exclude recurring payments.

The field being tested for the "Near" quality must be the final field selected in the "Fields to test for Duplicates" list.

Note that the results for Near and Similar places the matching records side-by-side. This facilitates more granular testing, such as calculating the actual number of days between the two transaction dates.

| | Vendor Number | Prod No | Invoice Number | Amount | Trans Date | Amount2 | Trans Date2 |
|---|---------------|---------|----------------|--------|------------|---------|-------------|
| 1 | 10380 | AC109 | 6936504 | 30.22 | 08/18/2019 | 30.22 | 08/22/2019 |
| 2 | 12191 | AC110 | 8194641 | 90.82 | 03/01/2019 | 90.82 | 03/05/2019 |
| 3 | 13012 | AC105 | 8227883 | 14.06 | 08/22/2019 | 14.06 | 08/26/2019 |

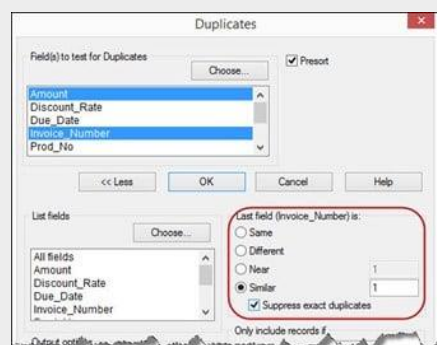

Same-Same-Similar

It frequently happens that vendors may re-issue the same invoice with a slightly different number, such as re-issuing invoice number "102" as "102a". Or input errors may replace one character so that it is entered as "I02".

The "Similar" parameter allows you to test for same vendor, same amount, invoice numbers within 1 character of each other.

To compare the invoice numbers, all blanks, leading zeros and punctuation are removed, data is made upper case and similar looking characters (e.g. 1 and I, or 0 and O) are matched.

Note how similar the two invoice numbers are for rows 4-6 with substitutions of "I" for "1".

| | Vendor Number | Amount | Invoice Number | Invoice Number2 | Trans Date | Trans Date2 | Prod No | Prod No2 |
|---|---------------|-----------|----------------|-----------------|------------|-------------|---------|----------|

| 7 | 13070 | 98,423.48 | 540613 | 5406613 | 08/03/2019 | 08/03/2019 | AC102 | AC102 |

Suppress Duplicates Parameter

This checkbox will exclude exact matches from the Near and Similar analytics. Exact duplicates are higher-risk, and the presumption is that those would have been already identified. This allows the analyst to focus on a different population without the risk of double-counting.

Counterparty Validation

Compliance and continuity both require frequent testing to detect suspect counterparties. The risks of transacting with counterparties on watch lists is high.

The GSA SAM list contains people and organizations that have committed fraud against the federal government. The OFAC list consists of parties that are suspected of or have committed terrorism. And there are many other watchlists worldwide that should be considered. There are multiple ways in which your counterparties (employees, customers, vendors, and contractors) can be compared to such lists.

Normalized Names and Addresses

Use the SortNormalize function to standardize the names and addresses of your counterparties and the population of the watch list. Then, use a many-to-many Join to identify matches. It's possible to integrate a fuzzy search dimension by specifying a filter in the Join for matches that are within one character of each other:

Difference(Vendor_Name, OFAC_Name) <=1

| | OFAC Entity Number | OFAC Address Number | OFAC Address | Vendor Number | Vendor Address | OFAC Address SORTNORM | Vendor Address SORTNORM |
|----|--------------------|---------------------|----------------------|---------------|------------------------------|-----------------------|-------------------------|
| 1 | 10614 | 15026 | 9311 Clancey Avenue | 10064 | 9311 Clancey Avenue | CLANCEY AVE 9311 | CLANCEY AVE 9311 |

Percent of Word Matches

The normalized names and addresses can be parsed into their individual words with a script. A matching word score can be calculated to display the % of matching words between any two pairs of names or addresses. This level of granularity allows you to quickly order the results with the highest % matches first for review.

| | OFAC Address Number | OFAC Address | Vendor Number | Vendor Address | Number of Matched Words | Match % |
|----|---------------------|--------------------------------------|---------------|------------------------------|-------------------------|---------|
| 1 | 15026 | 9311 Clancey Avenue | 10064 | 9311 Clancey Avenue | 3 | 100% |

| 16 | 5228 | 525 International Parkway, Suite 509 | 12431 | 1 Parkway North | 1 | 60% |

Outliers

Sophisticated statistical tests can rapidly identify outliers in almost any context. Outliers are transactions where the materiality is well beyond historical expectations. Because of their size, errors in processing them can result in misstatements. A very large outlier can also distort what would be considered "normal" for a population.

Population-Level Testing

A common criterion for outliers is that the values are more than two standard deviations above the average for a given population. The Statistics command can quickly generate the mean and the standard deviation:

| Field: Total_Cost | Number | Total | Average |
|-------------------|---------------|-----------------|--------------|
| Positive | <u>33,220</u> | 62,624,618 | 1,885 |
| Zeros | <u>2,230</u> | | |
| Negative | <u>2,894</u> | -5,462,144 | -1,887 |
| Totals | 38,344 | 57,162,474 | <u>1,491</u> |
| Abs Value | | 68,086,762 | |
| Range | | 164,474 | |
| Std. Dev | | <u>3,155.49</u> | |

To identify outliers, create a filter:

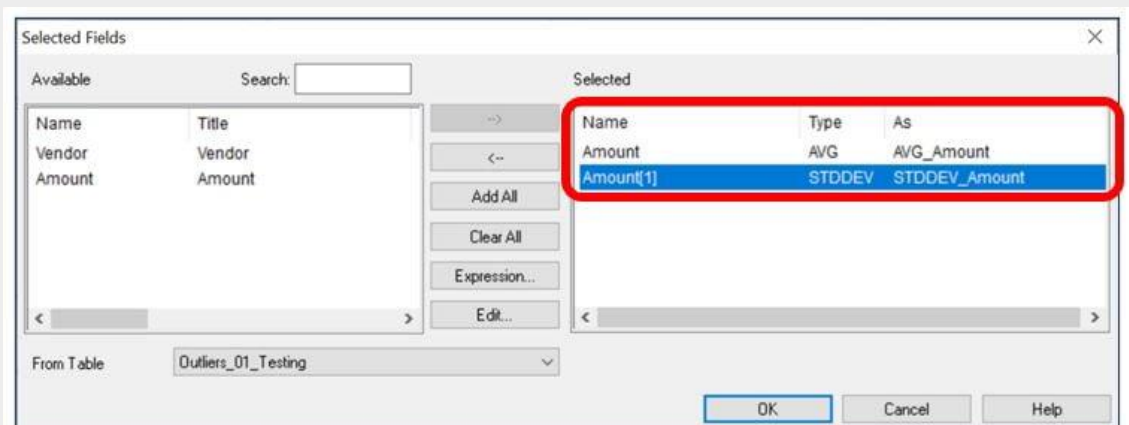

Total_Cost > 1491 + (2 * 3155.49)

Single-Category-Level Testing

It's also possible to identify outliers at a category level, such as vendors, using the enhanced Summarize command:

1. In the Summarize command, choose the Vendor field as the key field.
2. Open the "Fields to process" dialog
3. Select "Amount" twice
4. Change the Type to AVG and STDDEV

The output file contains the mean and the standard deviation for each vendor:

5. Create a computed field for the 2 SD threshold:
 $AVG_Amount + (2 * STDDEV_Amount)$

| | Vendor | AVG_Amount | STDDEV_Amount | Vendor_Threshold |
|----|--------|------------|---------------|------------------|
| 1 | 10031 | 792.80 | 28.6286 | 850.0572 |
| 2 | 10037 | 793.32 | 29.8515 | 853.0230 |
| 3 | 10039 | 793.79 | 29.2476 | 852.2852 |
| 4 | 10049 | 793.86 | 29.4538 | 852.7676 |
| 5 | 10056 | 791.32 | 29.5209 | 850.3618 |
| 6 | 10061 | 751.64 | 58.0991 | 867.8382 |
| 7 | 10064 | 693.17 | 29.3797 | 751.9294 |
| 8 | 10067 | 691.82 | 30.1734 | 752.1668 |
| 9 | 10069 | 692.12 | 29.5366 | 751.1932 |
| 10 | 10071 | 750.54 | 84.5419 | 919.6238 |
| 11 | 10072 | 787.59 | 106.6040 | 1,000.7980 |
| 12 | 10073 | 681.52 | 111.5505 | 904.6210 |
| 13 | 10074 | 672.99 | 175.6771 | 1,024.3442 |

6. Open the transaction file.
7. Join to the vendor threshold file and add the threshold field to the output.
8. Filter for Amount > Vendor_Threshold

Amount > Vendor_Threshold

| | Vendor | Amount | Vendor_Threshold |
|-------|--------|----------|------------------|
| 13787 | 10071 | 945.25 | 919.6238 |
| 13797 | 10071 | 943.03 | 919.6238 |
| 13809 | 10071 | 944.91 | 919.6238 |
| 13814 | 10071 | 936.60 | 919.6238 |
| 19085 | 10073 | 961.80 | 904.6210 |
| 19086 | 10073 | 947.16 | 904.6210 |
| 19087 | 10073 | 1,012.92 | 904.6210 |
| 19088 | 10073 | 997.62 | 904.6210 |
| 19093 | 10073 | 923.10 | 904.6210 |
| 19094 | 10073 | 905.23 | 904.6210 |
| 19095 | 10073 | 953.28 | 904.6210 |

Multiple-Category-Level Testing

It's also possible to add multiple levels to the category testing. For example, you could test by Vendor-Product combinations to test for pricing consistency.

Follow the same steps as in the previous example, using the Vendor and the Product ID as the key fields.

Technology

The phenomenal growth in scope and complexity of IT requires rigorous testing to ensure that your organization's data and processes are well-protected from the many threats that exist.

| | |
|--|---|
| Identity Management: Terminated Employees | Use a Join to match terminated employee data from HR to the Active Directory file to identify still-active accounts after employee departures. |
| SOD | Create a table containing each employee's pairs of duties with a many-to-many Join. Then use a matched Join to identify pairs of employee duties that are prohibited. |
| Event Log Analysis | Event logs tend to be unstructured. Create a "flat" file using static conditional fields to render the data in a format that can readily be analyzed. |
| System-Level Settings | Extract system settings at regular points in time, then use the Compare command to identify any changes that may have taken place. |
| Data Integrity | Data should be rigorously tested prior to analysis to determine whether it is appropriate to use. There are a variety of tests that can be executed to identify potential data issues. |
| Data Migration | Production data flows regularly to data warehouses, where analysts from different parts of the organization can use it without jeopardizing live data. Continuous monitoring of the migration process can quickly identify migration issues before they pose a serious threat. The Join and Compare commands are essential for this purpose. When new systems are implemented, those commands can also be used to verify that the data has successfully migrated with no integrity issues. |
| Data Normalization | Key fields can often be in varying formats from one system to another. To make them suitable for comparison, there are a number of functions that can be used in computed fields to normalize the data: <ul style="list-style-type: none">• SortNormalize• Normalize• Upper• Lower• Include• Exclude• String• Value• Zoned• AllTrim• Compact• Split• Substring |

ARBUTUS ANALYTICS

Arbutus delivers the very best in purpose-built audit analytics technology to meet the exacting demands of today's business environment. Auditors, business analysts, and fraud investigators rely on Arbutus to enhance their testing, analysis and compliance capabilities.
